... range, but one value is very far apart (4000 for ex.) then it minimizes the rest and doesn't give the rest a fair representation.

Standardisation Advantages and disadvantages:

Advantage: the scaling method is much better here when there are irregular values (like the example used before), it does give each value "have a say" and doesn't squash ~~smaller~~ numbers with high differences. as it uses the mean and standard deviation to scale.

~~Disadvantage:~~

Disadvantage: takes more time and calculations to scale correctly.
